

Project 6: REST Assured API Tester CI/CD Demo

Overview

This project demonstrates how to package an automated QA testing suite into a Docker container. The key learning objective is **Running an automated QA suite container against a deployed app**. Instead of deploying a long-running service, this pipeline builds a test runner image and executes it dynamically.

Prerequisites

Ensure the following are installed and running on your Jenkins server:

- Docker
- Java 17 & Maven

Step 1: Network Setup

Create a shared Docker network for your infrastructure and deployments:

```
docker network create jenkins-net
```

Step 2: Infrastructure Setup

Run SonarQube and Jenkins on the `jenkins-net` network:

```
# Run SonarQube
```

```
docker run -d --name sonarqube -p 9000:9000 --network jenkins-net  
sonarqube:lts-community
```

```
# Run Jenkins (with Docker socket mounted)
```

```
docker run -d --name jenkins -p 8080:8080 -p 50000:50000 --network  
jenkins-net -v /var/run/docker.sock:/var/run/docker.sock -v  
jenkins_home:/var/jenkins_home jenkins/jenkins:lts
```

Step 3: Jenkins Configuration

1. Log into Jenkins.
2. Install necessary plugins: Docker Pipeline, SonarQube Scanner, Pipeline.
3. Configure SonarQube Server in Manage Jenkins -> System.
4. Configure Global Tools (Maven, Sonar Scanner).

Step 4: Pipeline Execution

1. Create a new Pipeline job in Jenkins.
2. Choose "Pipeline script from SCM" or paste the contents of Jenkinsfile.
3. Run the build.

Note: During the "Execute Automated QA Suite" stage, Jenkins spins up a temporary Docker container purely to run `mvn test` against a target API, and then destroys the container immediately afterward using the `--rm` flag.

Step 5: Verification

Review the Jenkins console output to confirm the REST Assured API tests executed successfully and passed.
